

SS2000 TOUCH SCREEN

Federal Signal's SS2000 Touch Screen software is one of the latest technological advancements of the SMARTSIREN®. You now have the ability to operate the SMARTSIREN through a touch screen computer!

SMARTSIREN System Upgrade

Maximize your investment in the SMARTSIREN System by adding the SS2000 Touch Screen software. This is not a replacement for the SMARTSIREN System, but an upgrade to touch screen control of your vehicle's emergency warning system. Many agencies are responding to the increasing demand of computers on duty. Federal Signal realizes those challenges and will provide the technology to enhance the value of your computer investment.

System Compatibility

The SS2000 Touch Screen software is compatible with any SMARTSIREN system and can be installed on either new or pre-existing systems. The SS2000 Touch Screen software will automatically adapt to the SMARTSIREN system. The installer may then update the keypad text, select an open comport and determine the location of the program minimize button by using the Screen Editor. Although the SS2000 Touch Screen package will include all of the software, hardware, and cables needed for a complete and simple installation, a user-supplied laptop is necessary to upgrade the SMARTSIREN System.

System Redundancy

System redundancy is an important feature of the SS2000 Touch Screen package. While the touch screen software is active, the SMARTSIREN control pad will be inactive. If the computer becomes inactive or the touch screen control pad is minimized or closed, the original SMARTSIREN control pad will reactivate and continue to replicate the last selection.

Improved Visibility

Visibility of a system control pad is critical to assure proper operation of the emergency warning system and instills confidence in its operator. The addition of the SS2000 Touch Screen software to your laptop computer will improve the visibility of the control pad by placing it on the computer screen.

FEATURES

- Upgrades the SMARTSIREN System to Touch Screen Control.
- Each operation level of the SMARTSIREN system can now be programmed through the configurator.
- Includes USB and serial connectors.
- Installs on new or pre-existing SMARTSIREN Systems.
- SS2000 Touch Screen software offers system control redundancy.
- Improves the visibility of the system control head.
- Maximizes your computer investment.

Multiple screens allows the installer to program each level of operation.

The Screen Editor allows the installer to select text, comport, and the location of the minimized program.

HOW TO ORDER

1. Specify a model.

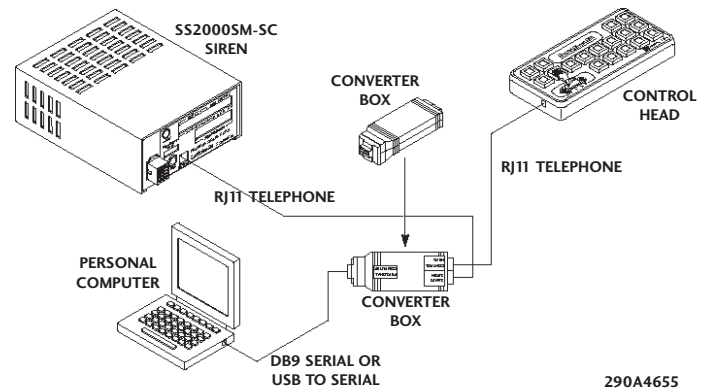

720200 SS2000 Touch Screen (Includes SS2000 Touch Screen software, programming software manual, interface converter box, and DB9 serial cable and USB to serial connector.)

System PC Requirements:

Memory – the table below shows memory requirements for the various versions of Microsoft Window systems. These are based on Microsoft's minimum recommendations – in some cases more memory is recommended for effective operation of the SS2000 Touch Screen software.

Supported Operating System	Minimum Memory Requirements (MB)
Windows® 98	64 (128 recommended)
Windows® ME	64 (128 recommended)
Windows® NT 4.x	128
Windows® 2000	128
Windows® XP	128

- Required disk space for installation of the application is estimated at 15 MB.
- Systems should have a minimum of a 450 MHz Pentium Processor.
- At least one serial port or USB port must be available for use in connecting to system.

System Application:

The converter box and additional cables are provided with each SS2000 Touch Screen software kit. The SS2000 siren, control head and personal computer is user supplied.
